Population diagnostics | 500 matched prompts per setting, seed 0
IPO | Temporal variance (t=30–149)
1e−3
IPO | Mean adjacent TV (t=30–149)
IPO | Top-response switch rate (t=30–149)
DPO | Temporal variance (t=30–81)
1e−2
DPO | Mean adjacent TV (t=30–81)
DPO | Top-response switch rate (t=30–81)
Uniform exploration mass ρ = 1 − λ
Each point is the prompt mean; seed 0 only. DPO comparison is restricted to the common valid window (30–81) after discovering baseline NaNs.
DPO baseline is invalid from t=82. Temporal variance alone does not establish recurrent oscillation.
